Table of Contents

Chapter 1.	About Visual Basic Essentials	11
Chapter 2.	Downloading and Installing Visual Studi.....	12
2.1	Getting Visual Studio	12
2.2	Downloading a Visual Studio Trial.....	12
2.3	Installing Visual Studio	13
2.4	Starting Visual Studio for the First Time	13
Chapter 3.	Creating a New Visual Basic Project	15
3.1	Creating a Project in Visual Studio	15
Chapter 4.	A Simple Visual Basic Example	17
4.1	Creating a New Project.....	17
4.2	Adding Controls to the Form.....	17
4.3	Setting Control Properties.....	19
4.4	Creating an Event Handler	20
4.5	Building and Running a Visual Basic Application	21
Chapter 5.	Visual Basic and Forms.....	23
5.1	Creating a New Form.....	23
5.2	Changing the Form Name	23
5.3	Changing the Form Title	23
5.4	Changing the Form Background Color	24
5.5	Changing the Form Background Image	25
5.6	Configuring the Minimize, Maximize and Close Buttons	26
5.7	Setting Minimum and Maximum Form Sizes	27
5.8	Specifying the Position of a Form on the Display	27
5.9	Changing the Form Border	27
5.10	Stopping a Form from Appearing the Windows Taskbar.....	28
5.11	Creating a Transparent Form	28
Chapter 6.	Designing Forms in Visual Studio	29

6.1	Visual Basic Forms and Controls	29
6.2	Double Clicking the Control in the Toolbox	30
6.3	Dragging a Dropping Controls onto the Form.....	31
6.4	Drawing a Control on the Form.....	31
6.5	Positioning and Sizing Controls Using the Grid	31
6.6	Positioning Controls Using Snap Lines	33
6.7	Selecting Multiple Controls	33
6.8	Aligning and Sizing Groups of Controls	34
6.9	Setting Properties on a Group of Controls.....	34
6.10	Anchoring and Autosizing Form Controls	35
6.11	Setting Tab Order in a Form	36
Chapter 7.	Understanding Visual Basic Events	37
7.1	Event Triggers.....	37
7.2	Wiring Up Events in Visual Studio	38
7.3	Setting Up a Visual Basic Timer Event.....	42
Chapter 8.	Hiding and Showing Forms in Visual Basic.....	45
8.1	Creating a Visual Basic Application Containing Multiple Forms	45
8.2	Understanding Modal and Non-modal Forms	47
8.3	Writing Visual Basic Code to Display a Non-Modal Form	47
8.4	Writing Visual Basic Code to Display a Modal Form	47
8.5	Hiding Forms in Visual Basic.....	48
8.6	Closing Forms in Visual Basic.....	49
Chapter 9.	Creating a Visual Basic MDI Form	50
9.1	What is an MDI?	50
9.2	Creating an MDI Parent and Child Forms in Visual Studio.....	51
9.3	Writing the Visual Basic Code to Add the Children to the MDI Parent.....	52
Chapter 10.	Creating Top-Level Menus in Visual Basic	54
10.1	Creating a Top-Level Menu	54

10.2	Deleting and Moving Menu Items.....	59
10.3	Assigning Keyboard Shortcuts to Menu Items.....	59
10.4	Programming Menu Items in Visual Basic.....	59
Chapter 11.	Creating Context Menus in Visual Basic	61
11.1	Adding Context Menus to a Visual Basic Form	61
11.2	Associating a Component with a Context Menu.....	63
11.3	Programming Visual Basic Context Menu Options	63
11.4	Compiling and Running the Application.....	64
Chapter 12.	Building a Visual Basic Toolba.....	65
12.1	Creating a Toolbar	65
12.2	Adding Tooltip Text to Toolbar Controls.....	66
12.3	Programming Toolbar Controls.....	67
12.4	Changing the Toolbar Position	68
Chapter 13.	Building a Visual Basic Status Bar	70
13.1	Adding a Status Bar to a Visual Basic Application	70
13.2	Adding Items to a Status Bar	71
Chapter 14.	Visual Basic Modules and Procedures	72
14.1	Visual Basic Code Modules.....	72
14.2	Visual Basic Code Procedures	74
14.3	Defining Visual Basic Subroutines	75
14.4	Passing Parameters to Functions and Subroutines.....	76
14.5	Defining Visual Basic Functions.....	77
Chapter 15.	Understanding Visual Basic Variable and Constant Types	80
15.1	Boolean Variable	80
15.2	Char Variable	80
15.3	Byte Variable	80
15.4	Date Variable.....	80
15.5	Decimal Variable	81

15.6	Double Variable.....	81
15.7	Integer Variable.....	81
15.8	Object Variable.....	81
15.9	Long Variable.....	81
15.10	Short Variable.....	81
15.11	String Variable.....	82
Chapter 16.	Declaring Visual Basic Variables and Constants.....	83
16.1	Declaring Visual Basic Variables.....	83
16.2	Initializing Visual Basic Variables.....	84
16.3	Assigning New Values to Visual Basic Variables.....	84
16.4	Referencing Variable Values.....	85
16.5	Understanding Variable and Constant Scope.....	85
16.5.1	Block Level Scope.....	85
16.5.2	Procedure Level Scope.....	85
16.5.3	Module Level Scope.....	86
16.5.4	Global Scope.....	86
16.6	Static Variables in Visual Basic.....	86
16.7	Declaring and Referencing Visual Basic Constants.....	87
Chapter 17.	Visual Basic Arithmetic.....	88
17.1	Understanding Expressions.....	88
17.2	Visual Basic Operator Precedence.....	89
17.3	Visual Basic Addition.....	89
17.4	Visual Basic Subtraction and Negation.....	90
17.5	Visual Basic Multiplication.....	90
17.6	Visual Basic Division.....	90
17.7	Visual Basic Exponentiation.....	91
17.8	Visual Basic Modulus Arithmetic.....	91
Chapter 18.	Visual Basic Comparison and Logic.....	92

18.1	Visual Comparison Operators	92
18.2	Visual Basic Logical Operators.....	92
Chapter 19.	Visual Basic Flow Control	95
19.1	Using If ... Then to Make Decisions	95
19.2	Using If ... Then .. Else to Make Decisions.....	95
19.3	Using If ... Then .. Elself to Make Decisions.....	96
19.4	Evaluating Multiple Possibilities using Select Case	97
19.5	Using the Visual Basic <i>GoTo</i> Statement	99
Chapter 20.	Visual Basic <i>For</i> Loops	101
20.1	Creating a Visual Basic <i>For</i> Loop.....	101
20.2	Incrementing a For Loop by a Value Greater Than 1	102
20.3	Early Exit of a For Loop.....	102
20.4	Continuing a For Loop	102
Chapter 21.	Visual Basic Do ... Loops.....	104
21.1	Creating a Visual Basic Do ... Loop	104
21.2	Visual Basic Do While Loops.....	104
21.3	Visual Basic Do Until Loops	105
21.4	Summary	106
Chapter 22.	Visual Basic Arrays	107
22.1	What is a Visual Basic Array	107
22.2	How to Declare a Visual Basic Array	107
22.3	Initializing a Visual Basic Array	108
22.4	Assigning Values to Individual Array Elements	108
22.5	Accessing Array Element Values	109
22.6	Finding the Size of an Array.....	109
22.7	Changing the Size of a Visual Basic Array.....	110
22.8	Clearing a Element Ranges from a Visual Basic Array.....	110
22.9	Sorting a Visual Basic Array	111

22.10	Searching for Array Elements	111
Chapter 23.	Visual Basic Multidimensional Arrays	112
23.1	Creating a Visual Basic Multidimensional Array	112
23.2	Assigning Values to Multidimensional Array Elements	112
23.3	Accessing Elements of a Multidimensional Array	113
23.4	Summary	113
Chapter 24.	Working with Dates and Times in Visual Basic	114
24.1	Creating and Initializing a Visual Basic Date	114
24.2	Accessing the Date and Time in a Date Variable	114
24.3	Formatting Dates and Times	115
24.4	Adjusting a Date or Time	116
24.5	Retrieving Parts of a Date or Time	117
24.6	Finding the Interval Between Two Dates or Times	117
24.7	Accessing the System Date and Time from Visual Basic	117
24.8	Checking if a Value is a Valid Date	118
Chapter 25.	Working with Strings in Visual Basic	119
25.1	Joining Strings in Visual Basic	119
25.2	Finding the Length of a String	120
25.3	Extracting Text from the Beginning of String	120
25.4	Extracting Text from the End of a String	121
25.5	Extracting Text from Anywhere in a String	121
25.6	Searching for a Substring	122
25.7	Trimming Leading and Trailing Spaces from a String	122
25.8	Replacing Text in String	123
Chapter 26.	Object Oriented Programming with Visual Basic	124
26.1	What is an Object?	124
26.2	What is a Class?	124
26.3	Defining a Visual Basic Class	124

26.4	Creating Visual Basic Class Properties.....	125
26.5	Defining Class Methods.....	125
26.6	Instantiating an Object from a Visual Basic Class	127
26.7	Accessing Object Properties and Methods	128
Chapter 27.	Accessing Databases Using Visual Basic	129
27.1	Connected to a Database	129
27.2	Selecting the Data Source	131
27.3	Linking Data Sources to an Application.....	132
27.4	Adding SQL Statements to a Visual Basic Application.....	134
Chapter 28.	Visual Basic and the DataGridView Control.....	136
28.1	Selecting the Data Source	137
28.2	Adding a DataGridView Control	138
28.3	Saving Changes to a DataGridView	139
28.4	Customizing the DataGridView Control	140
Chapter 29.	Working with Files in Visual Basic.....	141
29.1	Opening a Text File in Visual Basic	141
29.1.1	FileMode Options.....	141
29.1.2	FileAccess Options	141
29.1.3	FileShare Options.....	141
29.2	Writing to a File with Visual Basic	142
29.3	Reading From a File in Visual Basic	143
29.4	Detecting a Change to a File.....	144
Chapter 30.	Working with Directories in Visual Basic	145
30.1	Creating and Removing a Directory In Visual Basic	145
30.2	Obtaining a Directory Information and Contents Listings in Visual Basic.....	146
30.3	Extracting Parts of a Path Name in Visual Basic.....	146
30.4	Copying Directories in Visual Basic	147
30.5	Renaming a Directory in Visual Basic.....	147

Chapter 31. Drawing Graphics in Visual Basic	148
31.1 Drawing Filled Shapes in Visual Basic.....	148
31.2 Drawing in Visual Basic Using a Pen.....	150
31.3 Drawing Shapes in Visual Basic	151
31.3.1 Drawing a Ellipse.....	151
31.3.2 Drawing a Rectangle	151
31.4 Drawing Text in Visual Basic.....	152
31.5 Clearing a Drawing Area.....	153
31.6 Summary	153

Chapter 1. About Visual Basic Essentials

Visual Basic Essentials is intended to be of use to both novices looking to learn Visual Basic, and to those proficient in other languages that plan to cross-train. The Visual Basic language, combined with the Visual Studio, provides a uniquely powerful, yet easy to learn development environment allowing even the absolute beginner to rapidly create and deploy Windows applications.

Visual Basic Essentials begins with instruction on designing Windows forms in Visual Studio including tasks such as designing menu systems and toolbars and wiring up event procedures. The book then introduces the basic concepts of the Visual Basic language covering concepts such as Visual Basic variable types, looping, flow control, functions and subroutines. Once the basics are covered, topics such as single and multi-dimensional arrays, string handling, file I/O and date and time manipulation are explained. Finally, more advanced topics such as Visual Basic object oriented programming, database access and graphics drawing are detailed.

Throughout the book, liberal use is made of code excerpts providing practical examples of theory in action. It is intended that having read this online book, the programmer will be confidently developing Windows applications using Visual Basic and Visual Studio.

Chapter 2. Downloading and Installing Visual Studio

Everything you need to build Visual Basic applications is included with Microsoft Visual Studio. At the time of publication of this book the latest release of Visual Studio is Visual Studio 2008. The first step in learning Visual Basic is, therefore, to obtain a copy of Visual Studio.

2.1 Getting Visual Studio

There are a number of options in terms of getting a copy of Visual Studio. If you work for a company which has Visual Studio licenses available then the first step is to talk to your IT department to see if they can provide you with a license, or purchase one for you.

If you do not have access to a purchased Visual Studio license, or lack the funds to buy a copy the best option, and actually the ideal option for those learning Visual Basic, is to download a trial version from Microsoft's web site. This will give you a 90 day trial period to use all the features of Visual Studio. Given that this book will teach you everything you need to know to program in Visual Basic the 90 day trial period will give you plenty of time to learn Visual Basic with time to spare to decide if you want purchase a fully licensed copy of Visual Studio.

In this chapter of Visual Basic Essentials we will assume that you are downloading and installing the trial version of Visual Studio.

2.2 Downloading a Visual Studio Trial

To work through the examples in this book, Visual Studio Professional Edition is recommended.

Trial copies of Microsoft Visual Studio Professional Edition are available from the trials page of the Microsoft web site. From this page, you can choose to download a trial, or order a trial DVD.

The download is approximately 3GB in size so will take quite a while to download. Also, the download is an ISO image of the Visual Studio installation DVD so a DVD burner will be needed to write the image to a disk before it can be used for installation. Alternatively the image may be mounted as a virtual CD using a tool such as Virtual Clone Drive, or the ISO image may be unpacked using WinZip.

If you do not have a high speed internet connection or a DVD writer, Microsoft will ship you a free DVD (although they will charge you a small fee to cover the shipping costs).

Once you have either downloaded the ISO image, or received the copy shipped to you by Microsoft the next step is to install Visual Studio.

2.3 Installing Visual Studio

To install Visual Studio, place the DVD in the DVD drive of your system or navigate to the directory where the ISO image has either been mounted or unpacked. If your system is configured to *autorun* when a CD or DVD is inserted into the drive, then the installation screen should appear. Alternatively, manually execute the *Setup* installer.

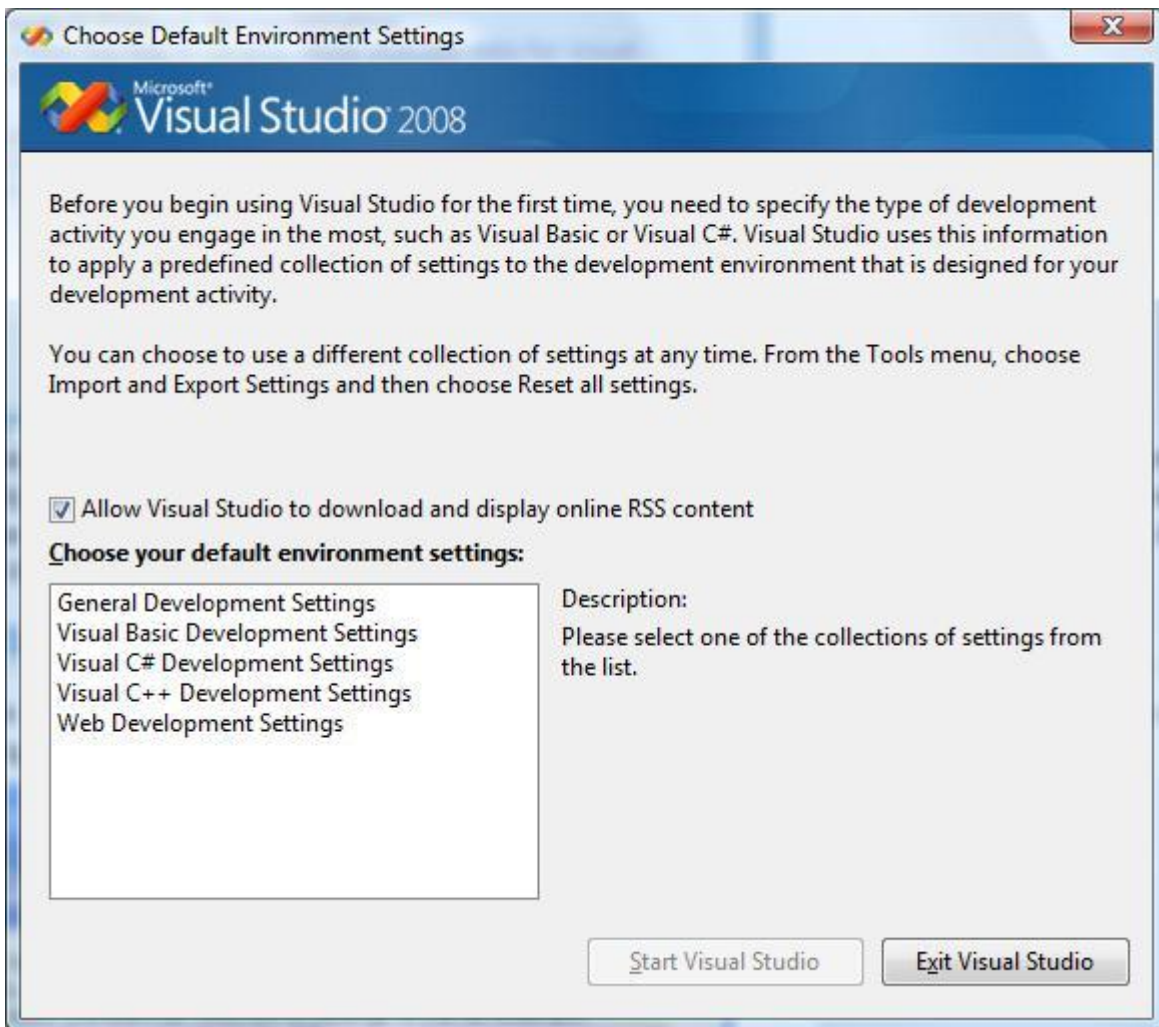

When the installer has started the following window should appear:

Click on the *Install Visual Studio* link to begin the installation process. Visual Studio supports a number of different programming languages in addition to Visual Basic (such as C#, J# and C++). If you only plan to use Visual Basic then choose the custom installation option and uncheck the boxes for the other languages. This will speed up the installation process and reduce the amount of space required to install Visual Studio. If you need to work with the other programming languages at a later date you can re-insert the installation DVD. The installer will then start in Maintenance Mode and allow you to add and remove support for other languages.

2.4 Starting Visual Studio for the First Time

Once the Visual Studio installation is complete you are ready to start it up. Find Visual Studio in the Windows Start menu and select it. The first time Visual Studio is run it will ask you which programming language you would like to use as the default:

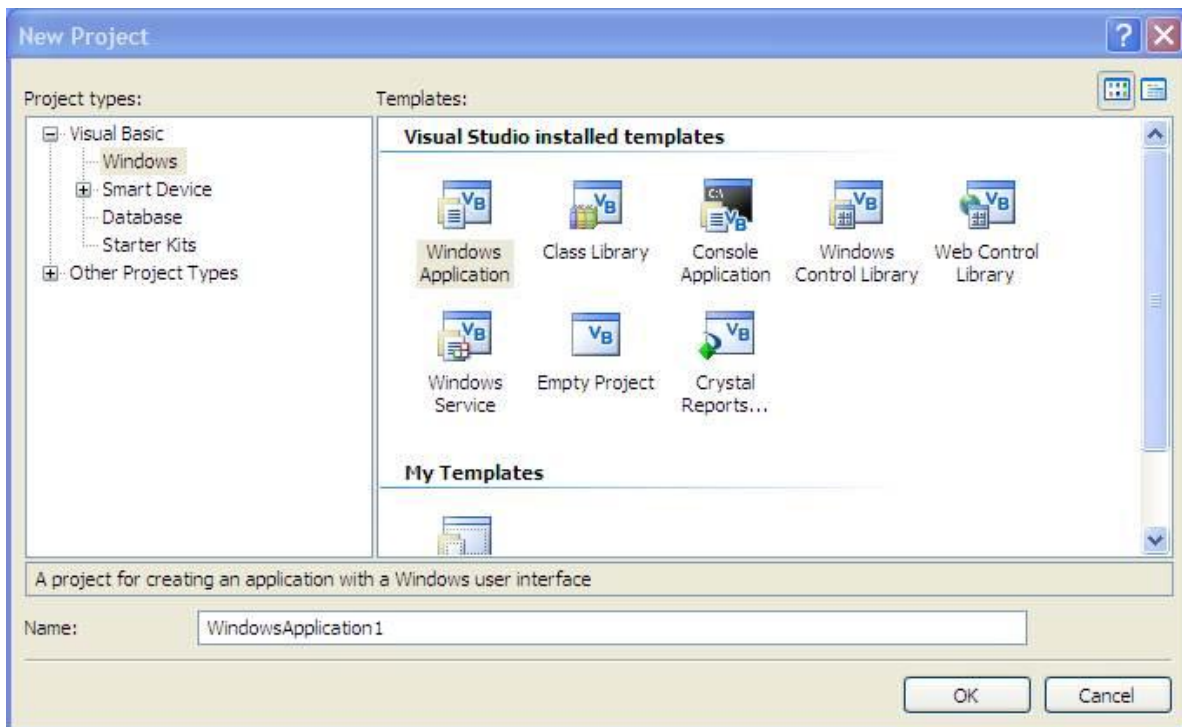

Select *Visual Basic Development Settings* from the list and click on the *Start Visual Studio* button. The main Visual Studio window should appear and you are now ready to start learning Visual Basic.

Chapter 3. Creating a New Visual Basic Project

Visual Studio uses the concept of *projects* to contain everything to build an application using Visual Basic. Typically there will be one Visual Studio project per individual application you develop. In this chapter we will look at creating a new Visual Studio project.

3.1 Creating a Project in Visual Studio

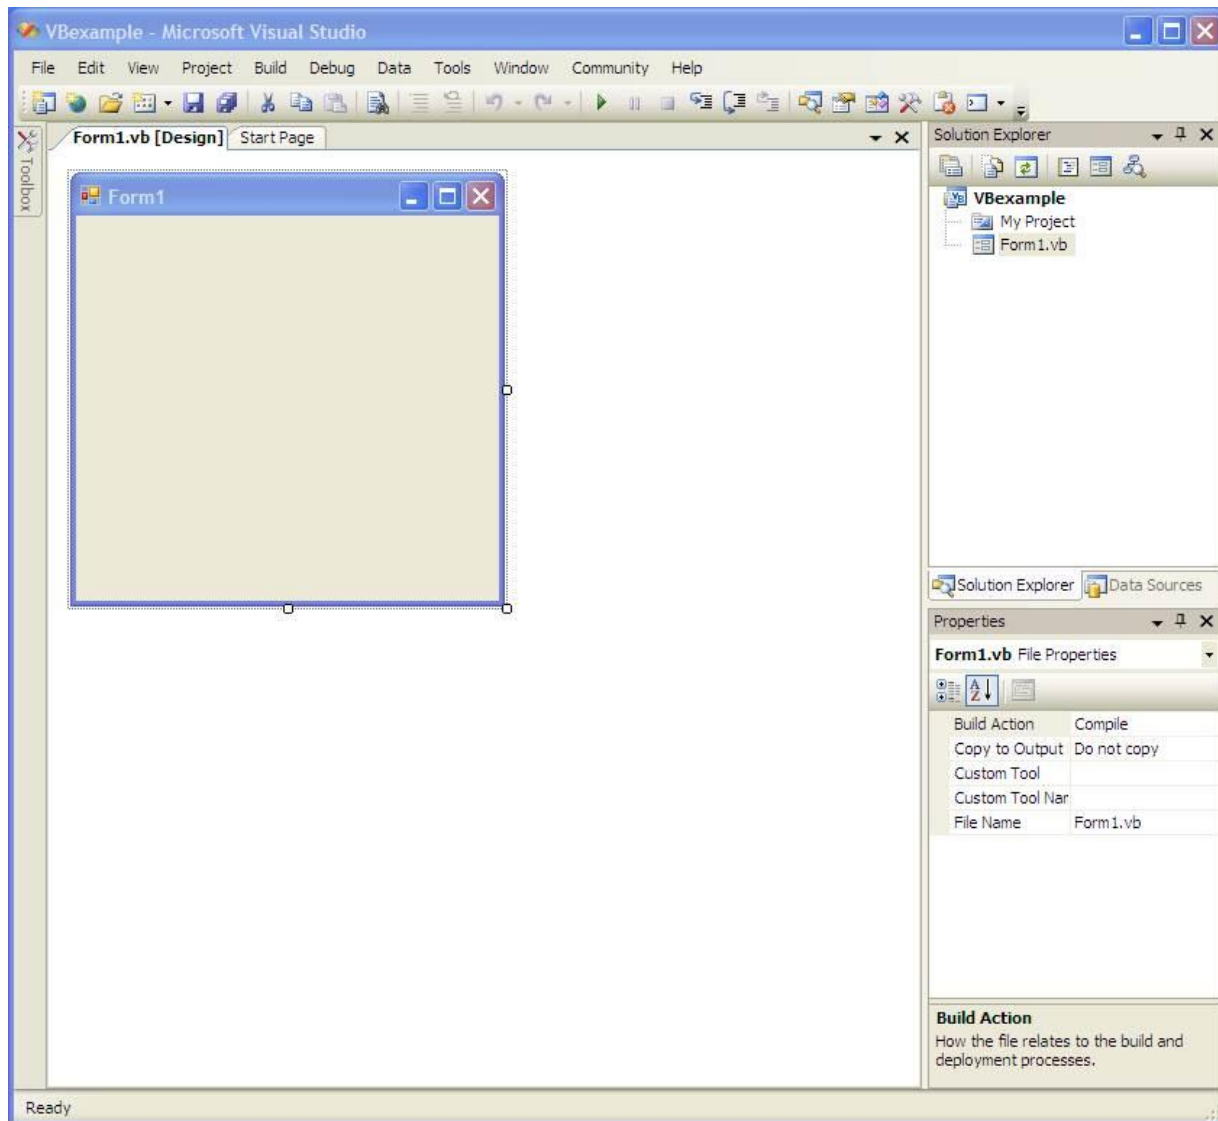

Now that Visual Studio is installed it is time to create a new project. Begin by starting Visual Studio from the Windows Start menu. When the main Visual Studio Window appears click on the *File* menu and select *New Project*. Visual Studio will display the "New Project" dialog shown below:

The *New Project* dialog provides a number of options with regard to the type of project being created. In this example we are going to build a Windows Application. A Windows Application is a graphical application (in other words an application that appears in a window and contains buttons, text fields and all the other graphical items we expect to see when we run Microsoft Windows applications).

Select the *Windows Application* icon from the New Project dialog and give your new project a name by typing it into the *Name:* field (for example you might want to name your project "VBexample"). Click on the *OK* button to create the project. Once the project is created Visual

Studio will display the new project, which at this point consists of a single form, ready for us to start adding visual components:

Now that we have created a new project in Visual Studio it is time to move on to the next chapter and create a simple Visual Basic application.

Chapter 4. A Simple Visual Basic Example

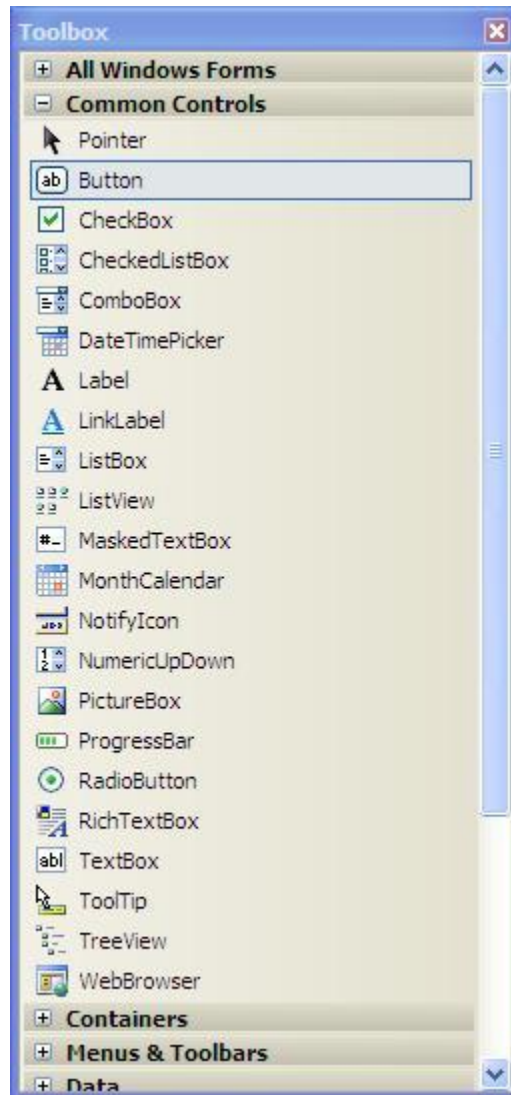

It is often helpful when learning a new programming language to start out with a very simple example. In this chapter we will create a small sample Visual Basic application. The purpose of this example is to provide an early confidence boost for those completely new to Visual Basic by showing just how easy it is to create an application.

4.1 Creating a New Project

The first step is to create a new project to contain our example Visual Basic Application. Start Visual Studio and select *File->New project*. From the new project dialog select *Windows Application* and name the project *myVBapp* and click on *Ok* to create the new project. Once the new project is created, Visual Studio will display a blank form ready for us to design the user interface of the application.

4.2 Adding Controls to the Form

For the purposes of our example Visual Basic application we are going to add two controls to our form; a push button and a label. To achieve this we first need to access the Visual Studio Toolbox. Along the left hand side of the Visual Studio main window you should see a tab labeled *Toolbox*. Click on this tab to display the *Toolbox*. It should appear as follows:

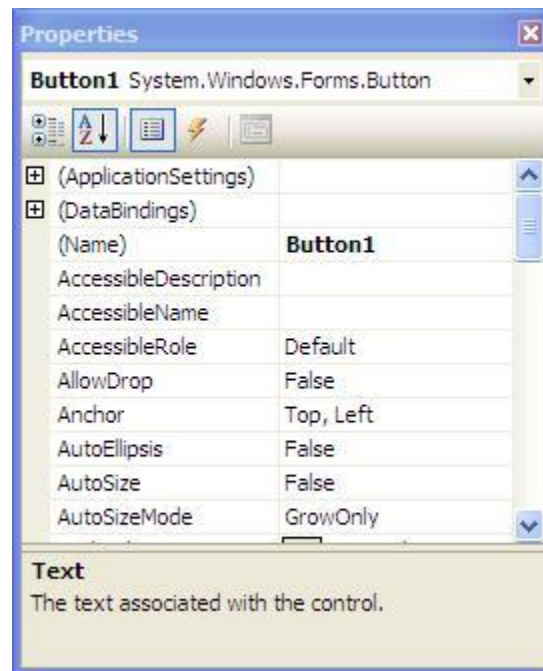

This Toolbox contains all the controls that may be used to build a Graphical User Interface for a Windows application. The toolbox will auto-hide by default, that is it will disappear when the mouse pointer is moved away from it. To make it permanently visible click on the push pin icon at the top of the toolbox window. Once it is pinned in place it will not auto-hide. It is also possible to detach the toolbox so that it will float and can be positioned anywhere on the desktop. To do so, simply click on the toolbox title area and drag it.

Controls are added to the Form by clicking on the required control in the Toolbox and dragging it to the desired location on the Form. To add a label to the form, click on the Label control in the Toolbox, drag it to the center of the Form and release the mouse button. The new label will then appear in the Form at the point you dropped it.

Next we need to add a button. Grab a Button from the Toolbox and drag and drop it on the Form. Use the mouse to move the controls around the Form until you have a layout you are happy with.

4.3 Setting Control Properties

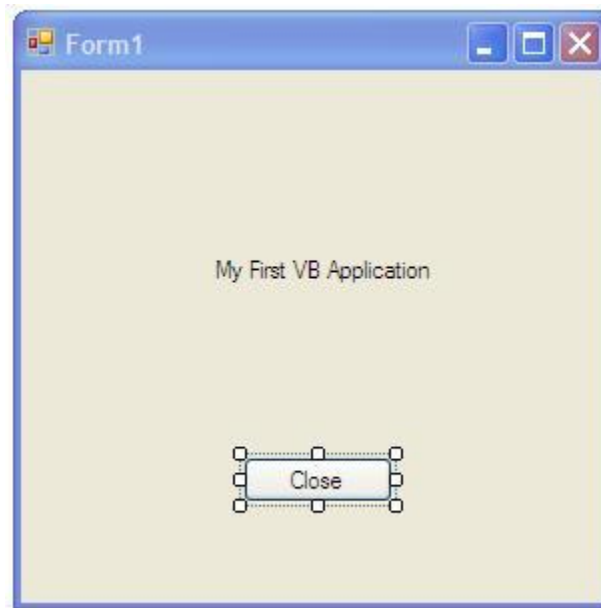

Now that we have added the controls to our Form we need to change some of the characteristics of these controls. This is done by changing the *Properties* of the controls. Properties are a group of settings that allow the appearance and behavior of controls to be changed. For example, there is a property for changing the text displayed on a label, the color of a button, the font of the text on a button and so on. Properties of a control are changed using the Visual Studio *Properties* panel which is, by default, displayed in the bottom right hand corner of the main dialog:

The properties displayed at any one time are related to the currently selected control in the Form. If you click on the Label and then the Button in your Form you will see the properties panel change to reflect the current selection.

To begin with, we will change the text of the Label control. Select the Label control in the form and then scroll down the list of properties until you find *Text*. This is the property which defines the text to be displayed on the currently selected Label control. Change this from the current value ('Label1') to read *My First VB Application*. Notice that as soon as you change this property the Label in the Form changes to reflect the new property setting.

Select the Button control in the Form and change the *Text* Property for this control to read *Close*. Re-position the controls in the Form if necessary. You should now have a Form which looks something like the following:

4.4 Creating an Event Handler

The next step is to make the *Close* button do something when it is pressed. Before we do that, however, we need to give the button a more meaningful name. Visual Studio has given the button a default name of *Button1*. While this is fine for a small design, it will quickly become difficult to work with such names in larger applications containing many buttons. With the Button selected in the Form, scroll up to the top of the properties list and change (*Name*) from *Button1* to *closeButton*.

Having changed the name we can now add an event to the button. Double click on the *Button* in the Form to display the event code for the *closeButton* control. Visual Studio will display the following code:

```
Private Sub closeButton_Click(ByVal sender As System.Object, ByVal e As
    System.EventArgs) Handles closeButton.Click

End Sub
```

This is a Visual basic Subroutine where code is placed to define what happens when a Click event is detected on the button (i.e. the user clicks on the button in the user interface of our

application). In this example we want the application to close when the *closeButton* is pressed. To achieve this we add a single line of Visual Basic code to the *closeButton_Click()* sub-routine as follows so that the code calls the *Close()* method to exit the application:

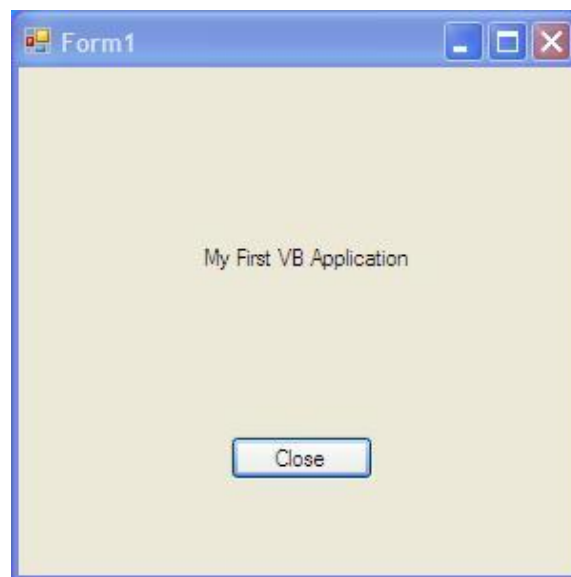

```
Private Sub closeButton_Click(ByVal sender As System.Object, ByVal e As
    System.EventArgs) Handles closeButton.Click
    Close()
End Sub
```

4.5 Building and Running a Visual Basic Application

Now that we have completed the design and implementation of a simple Visual Basic application we can compile and run it. To build the application, select *Build myVBapp* from the Visual Studio *Build* menu. Assuming there are no problems the application should compile without any errors (the message *Build succeeded* should appear in the status bar at the bottom of the Visual Studio screen).

Once built, the application can be run by selecting *Start Debugging* from the *Debug* menu. An even quicker way of building and running the application is to simply press **F5**. This will compile and run the application without having to use any menu options. As you develop Visual Basic applications in Visual Studio you will find yourself using the **F5** shortcut more than any other key on your keyboard.

After a few seconds the application should appear just as you designed it in the Visual Studio designer:

Try out the Click event on the *closeButton* control by clicking on the *Close* button to close the application.

Congratulations - you have designed, built and run your first Visual Basic application.

Chapter 5. Visual Basic and Forms

The Windows Form is a vital component in the development of any Windows-based application. Forms essentially provide the windows that make up a Windows application. In fact, the terms window and form are often used interchangeably. Forms allow the Visual Basic developer to create windows and layout controls (such as buttons, labels etc) in those forms to provide the application's user interface.

In the *Chapter 6 - Designing Forms in Visual Basic* we will look at how to layout controls inside a form. Before we reach that stage, however, there are a surprising number of ways in which the form itself can be modified and configured. We will cover these options in detail in this chapter.

5.1 Creating a New Form

Throughout this chapter we will work with a form in a new project. Begin by starting Visual Studio and creating a new Windows Application project (see *Chapter 3 - Creating a New Visual Basic Project* for details of how to do this). Name the project *VBforms*.

Once the new project is created you will see a Form in Visual Studio ready for you to begin work.

5.2 Changing the Form Name

All objects in a Visual Basic application need a name so that they can be referenced in the code. When a new object is added to an application in Visual Studio it is assigned a default name which usually consists of the object type and a number. For example the first form object in an application is named *Form1*, the second *Form2*, and so on.

To change the name of a Form to something more meaningful, simply click in any area of the Form in Visual Studio and change the (*Name*) value in the *Properties* panel.

5.3 Changing the Form Title

Each form represents an application window. The text displayed in the title bar for each window should be changed to display something meaningful. This should either be the name of application, or a description of the form's function (for example *Order Entry* or *Sales Report*).

The value of the text to be displayed in the window title is defined by the form's *Text* property. To change the title of the form, therefore, select the *Text* value in the *Properties* panel and change it to a new value (for example, 'My Form Example'):
